|-------------|----------------------------------------------|
| Prepared by | Esha Majumdar                                |
| Date        | 10 June 2026                                 |
| Version     | 1.0                                          |
| Status      | Draft                                        |
| Tool        | Power BI Desktop                             |
| Dataset     | IBM HR Analytics Employee Attrition (Kaggle) |

## 1. Business Question

The HR department wants to understand why employees are leaving and which employee segments are at highest attrition risk, so they can take targeted retention actions.

## 2. Problem Background

High employee attrition is costly for any organization. Every time an employee leaves, the company spends time and money on recruitment, onboarding, and training a replacement. By analyzing historical HR data, we can identify patterns that predict who is likely to leave and why.

This analysis will help HR and department heads make informed decisions about where to focus their retention efforts.

## 3. Stakeholders

| Stakeholder      | Role      | Interest                                           |
|------------------|-----------|----------------------------------------------------|
| HR Manager       | Primary   | Wants to understand why people leave and act on it |
| Department Heads | Secondary | Want to know which teams are at risk               |
| Finance Team     | Tertiary  | Concerned about the cost of high turnover          |

## 4. KPIs to Track

The following metrics will be measured and visualized in the Power BI dashboard:

- Overall attrition rate (%)
- Attrition by department and job role
- Attrition by age group and tenure (years at company)
- Average monthly income vs attrition
- Overtime vs attrition correlation
- Job satisfaction score distribution among leavers vs stayers

## 5. Scope

### In Scope

- Analysis of the IBM HR Analytics dataset (1,470 employee records, 35 variables)
- Identification of high-attrition employee segments by department, age, income, and tenure
- Power BI dashboard with 3 report pages
- Written insight summary with recommendations

### Out of Scope

- Real company data or live HR systems
- Predictive modelling or machine learning
- Payroll or recruitment system integration

## 6. Assumptions

- The IBM dataset is used for learning purposes only and does not represent a real organization
- All analysis will be done using Power BI Desktop (free version) and Microsoft Excel
- No access to a data team is assumed; all data preparation will be done manually

## 7. Deliverables

| Deliverable                | Description                           |
|----------------------------|---------------------------------------|
| Project Charter            | This document                         |
| Cleaned Dataset (.xlsx)    | Prepared data with calculated columns |
| Data Dictionary (.xlsx)    | Column definitions and data types     |
| Power BI Dashboard (.pbix) | 3-page interactive report             |
| Insight Summary (.docx)    | Findings and recommendations          |
